PEHero

Agentic AI for private equity deal teams.

22 specialist agents · pipeline kanban · LBO modeling · text-to-SQL analytics

TOUR

What you'll see

Six product surfaces, in order of a deal's life.

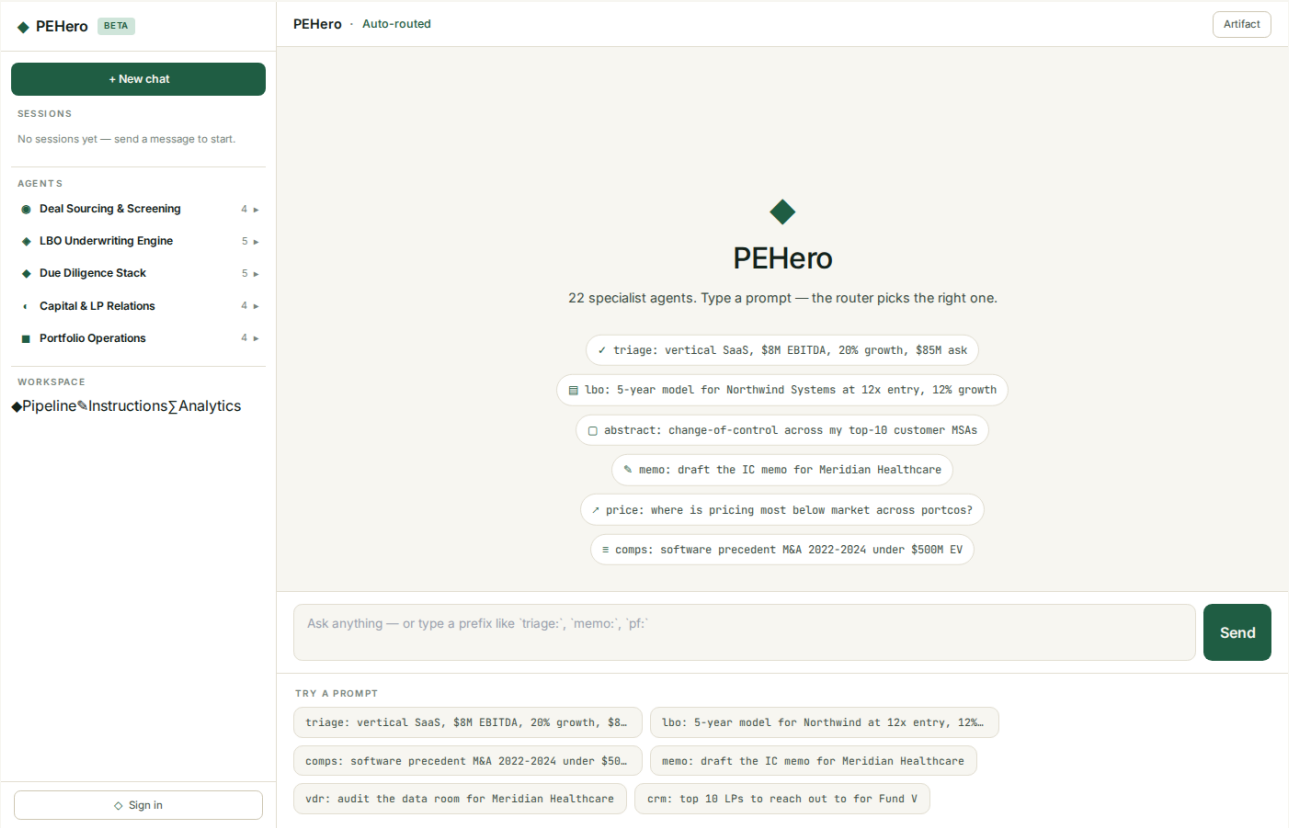
01	**Chat — 22 agents, SSE streaming, artifact side pane**	triage, LBO, IC memo, VDR audit
02	**Pipeline — kanban across 10 deal stages**	sector + ownership filters, click into deal
03	**Deal detail — brief on the right, chat in the centre**	LTM, top customers, DD findings, LBO
04	**Analytics — text → SQL → Plotly chart**	sector multiples, stage counts, LP mix
05	**Instructions — edit the 22 agent prompts**	saves to prompts/system/*.md, hot-reloads
06	**Extensions — web search + Baltic registries**	Tavily/EXA · LT, LV, EE business registries

01 · CHAT

One chat, 22 specialists

Type a prefix or plain English — the router picks the right agent.

- Left nav: sessions, the 22 agents by category, Pipeline / Instructions / Analytics links.
- Centre: the transcript. Gemini-style contextual sample cards under the input.
- Right: the artifact pane — tables, citations, memo previews stream in.
- SSE streams tokens + tool calls with a live thinking indicator.



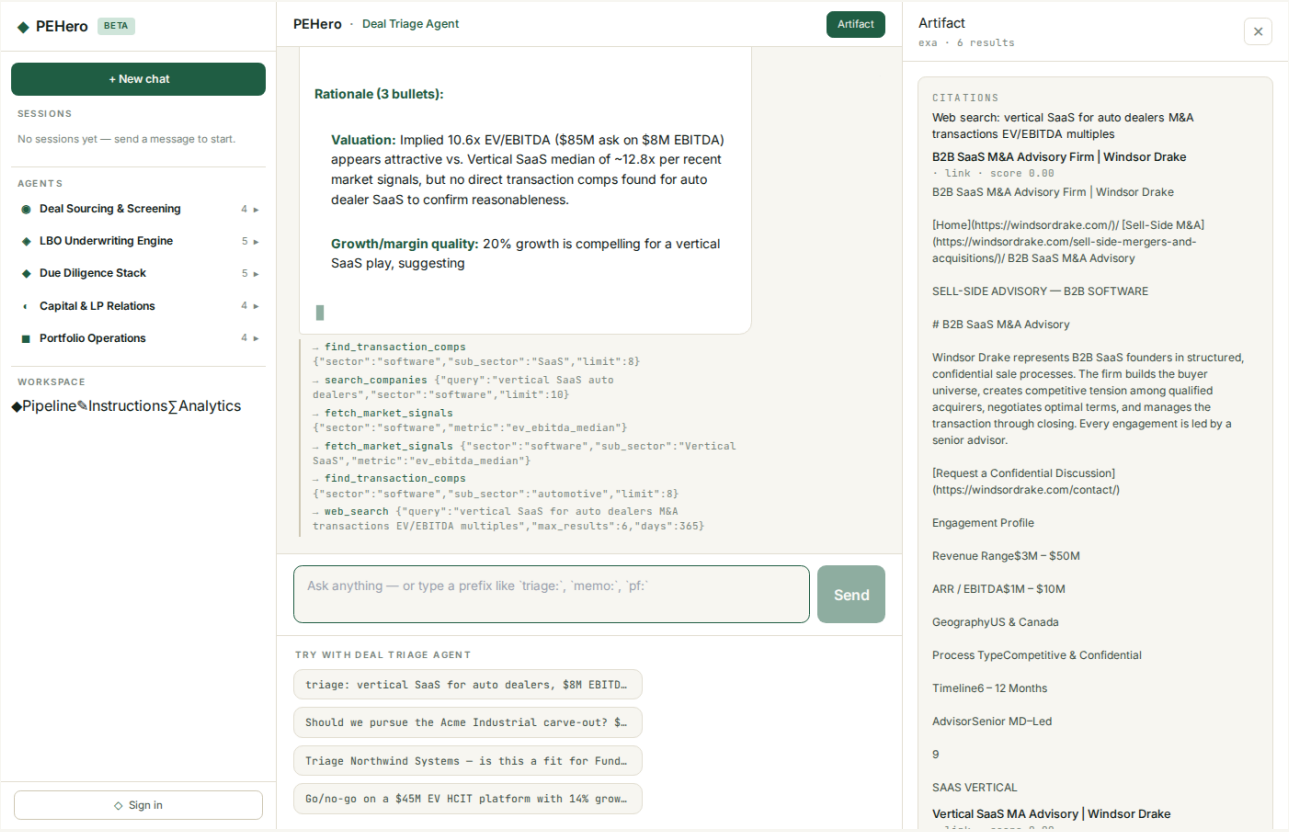
Empty chat + contextual sample cards

01 · CHAT

Deal Triage — go / no-go in 90 seconds

Prefix routing → triage: … returns a 3-bullet decision.

- `triage:` prefix goes straight to the Deal Triage Agent.
- Calls search_companies, find_transaction_comps, fetch_market_signals.
- Returns verdict, 3-bullet rationale, and a concrete next step.
- 'Next step — X' pattern surfaces a follow-up button to continue.



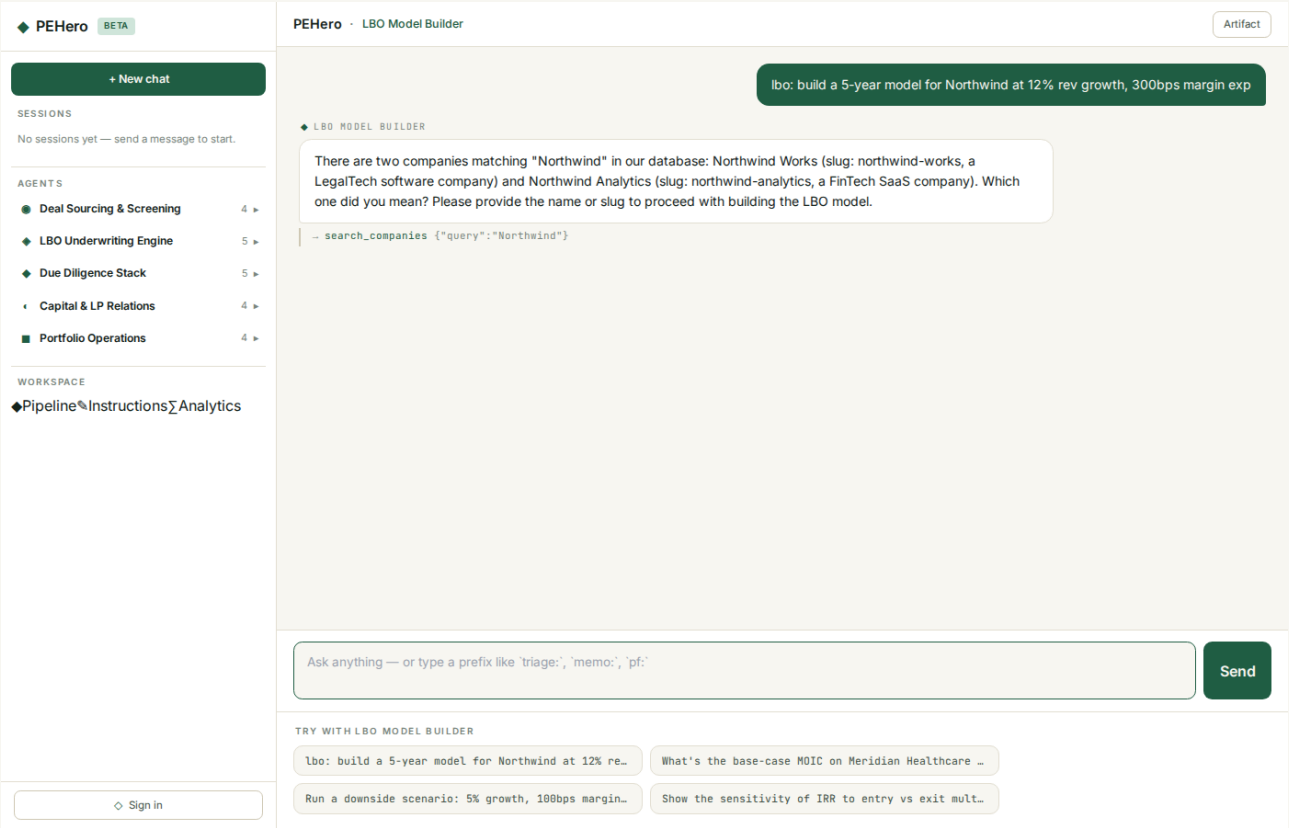
Live triage on synthetic vertical-SaaS target

01 · CHAT

LBO Model Builder

5-year model + sensitivity from one sentence of assumptions.

- Normalizes LTM financials with QoE add-backs.
- Projects revenue, margin, capex, interest, FCF, debt paydown.
- Writes the run to pehero.lbo_models — Return Metrics reads it back.
- Artifact: year-by-year table with MOIC + levered IRR.



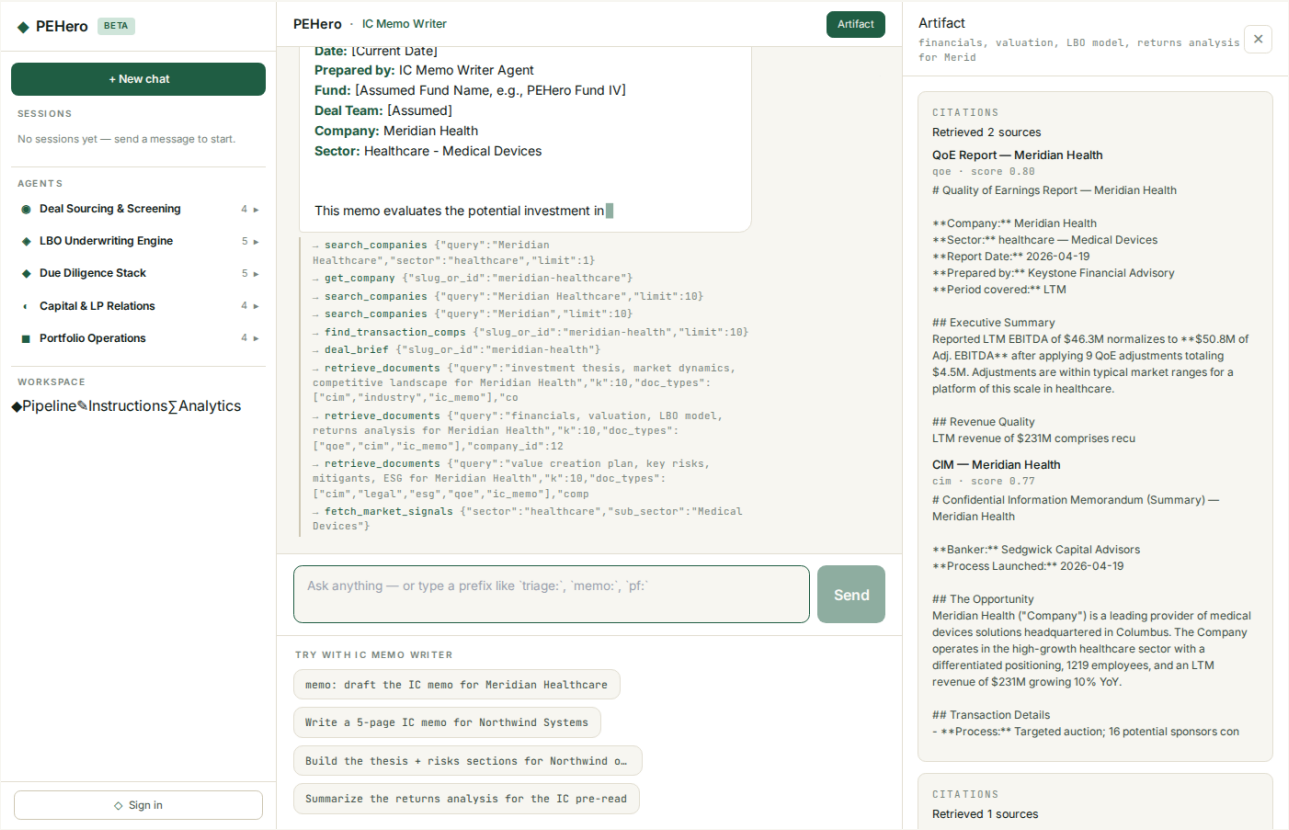
LBO built from a plain-English prompt

01 · CHAT

IC Memo Writer

Exec-ready memo straight from the deal's own data.

- Pulls deal brief, LTM, LBO, debt stack, comps, DD findings.
- Drafts full sections: Thesis, Market, Financials, VCP, Risks, Recommendation.
- Every quantitative claim cites a tool call — no fabrication.
- IC-length by default; configurable to a 1-page summary.



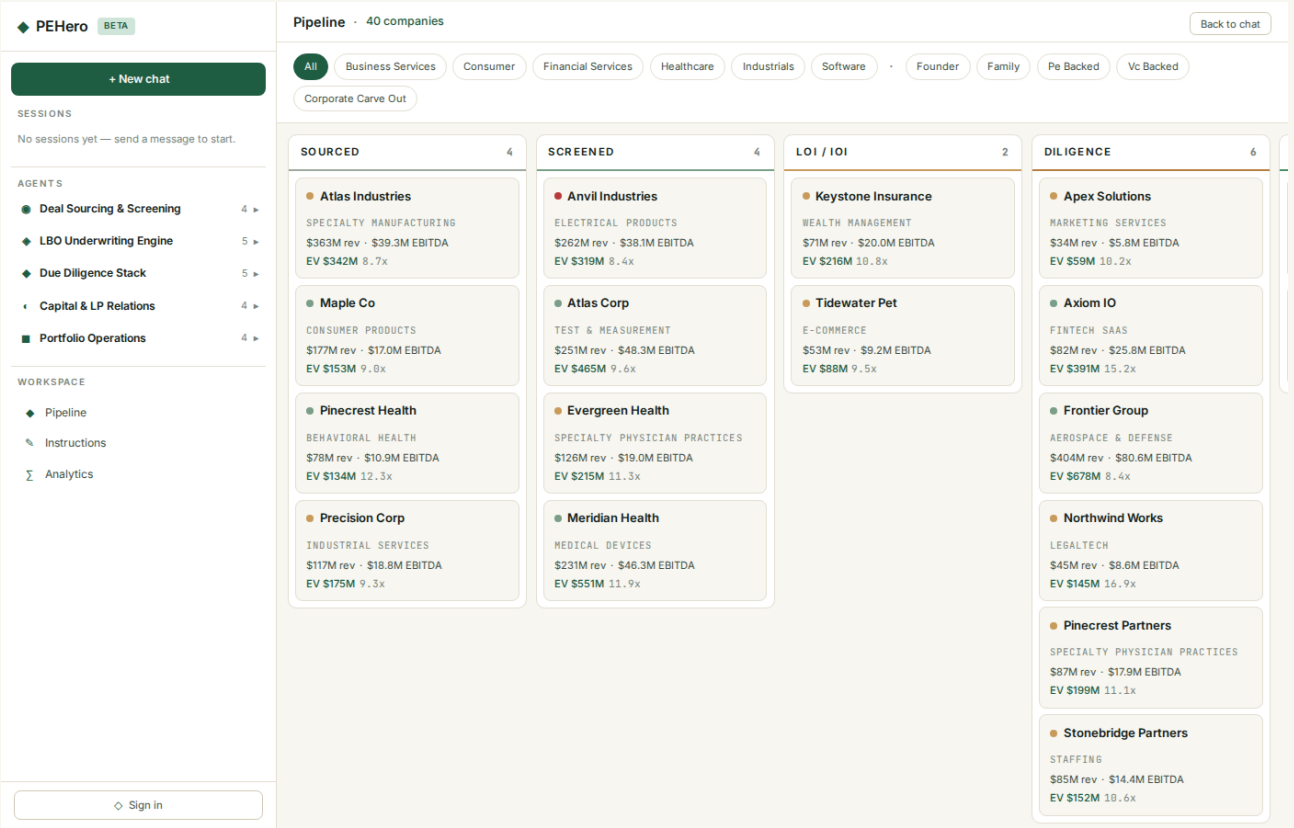
IC memo generated from synthetic data

02 · PIPELINE

Kanban across 10 deal stages

Sourced → Closed / Held / Exited — every live target on one board.

- Card = company with sector, LTM rev/EBITDA, ask EV + multiple.
- Heat dot on each card reflects seller intent (cold/warm/hot).
- Sector + ownership chips filter the board in a click.
- Click a card → the deal detail page.



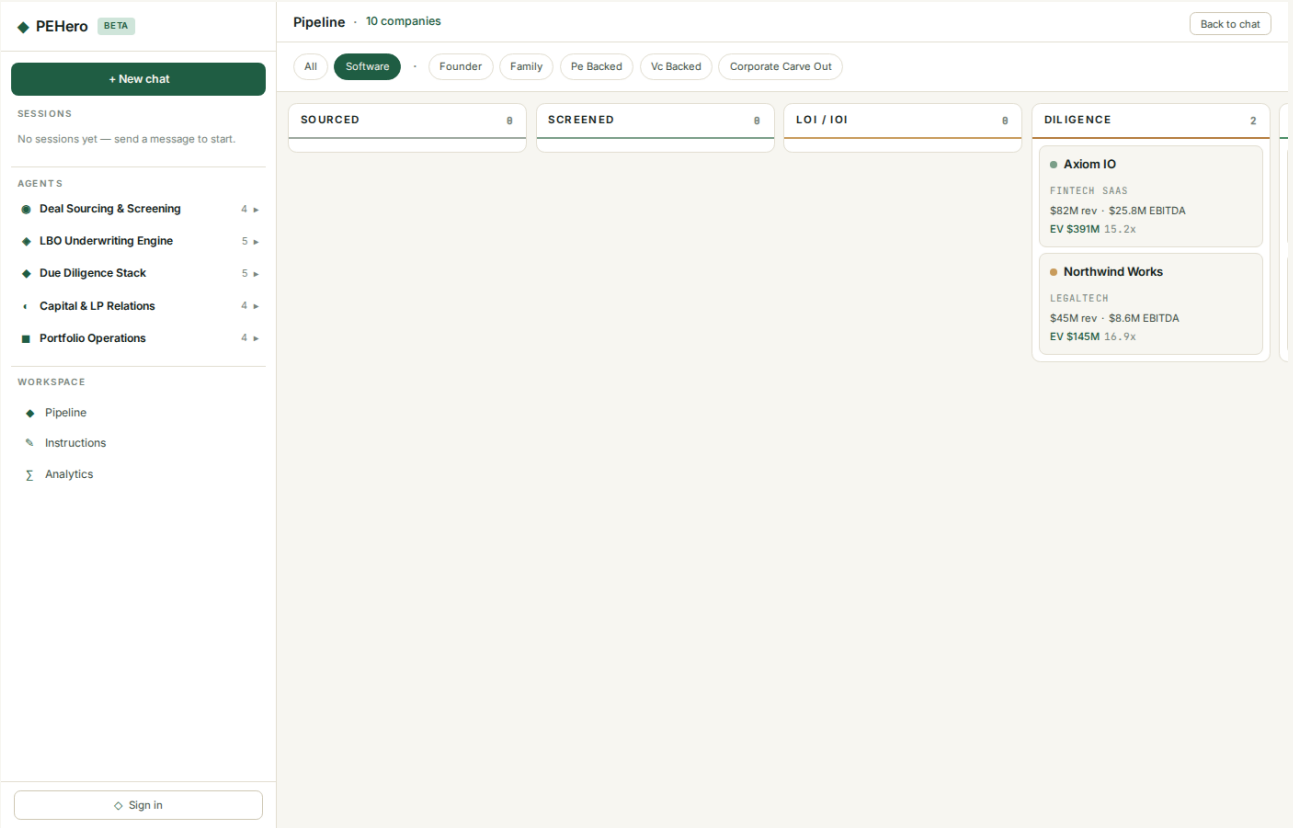
Full pipeline kanban

02 · PIPELINE

Filtered — software pipeline only

Narrow to a sector in one click; board re-groups by stage.

- Filter chips: sector · ownership (founder / family / PE / VC / carve-out).
- All cards update instantly without a page jump.
- Great for mandate conversations: 'show me LMM software deals only'.
- State is in the URL so the view is shareable.



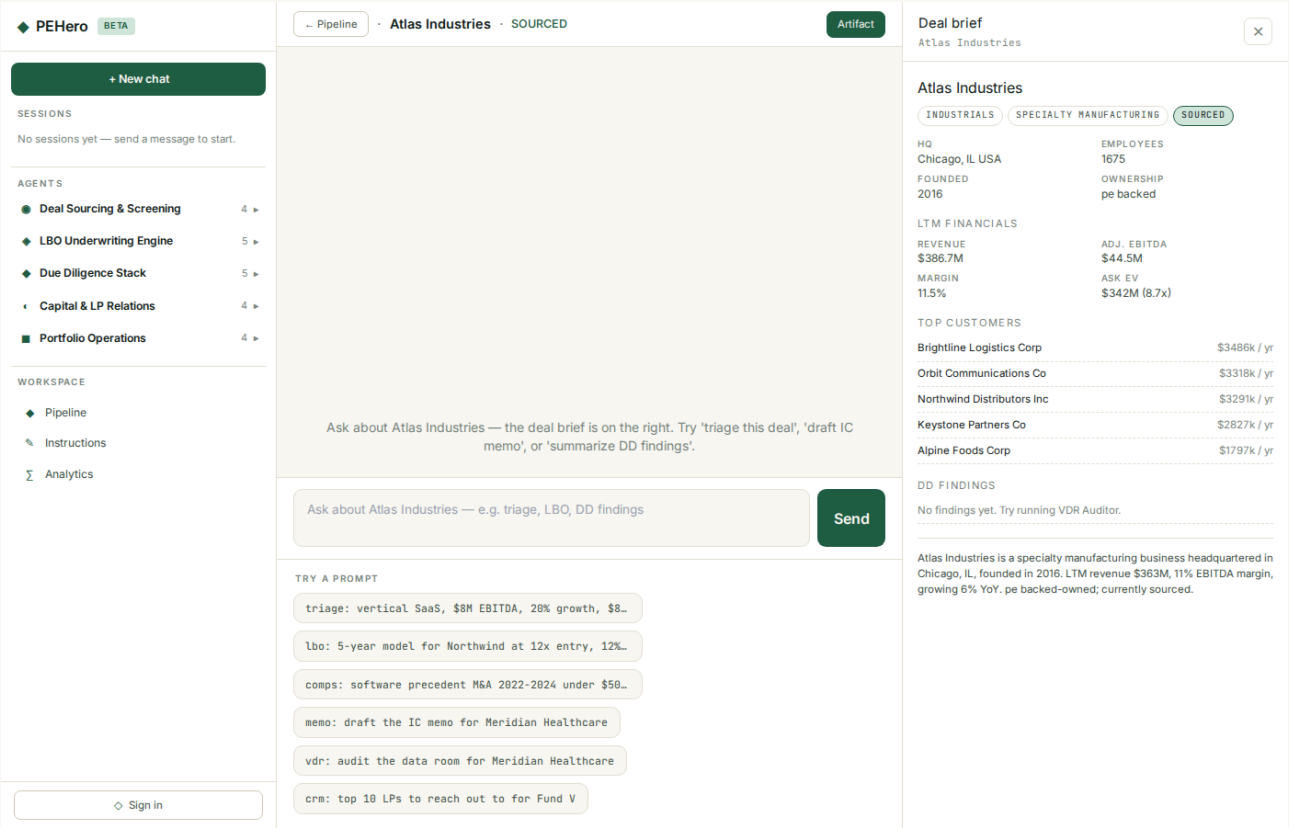
?sector=software

03 · DEAL DETAIL

Every deal has its own workspace

Brief on the right, chat in the centre, artifacts stream in from tool calls.

- Right pane: HQ, LTM financials, top customers, DD findings, margin + multiple.
- Centre: per-deal chat. Ask 'triage this', 'draft IC memo', 'show DD findings'.
- Any agent can be invoked without leaving the deal.
- New artifacts from tool calls land in the right pane alongside the brief.



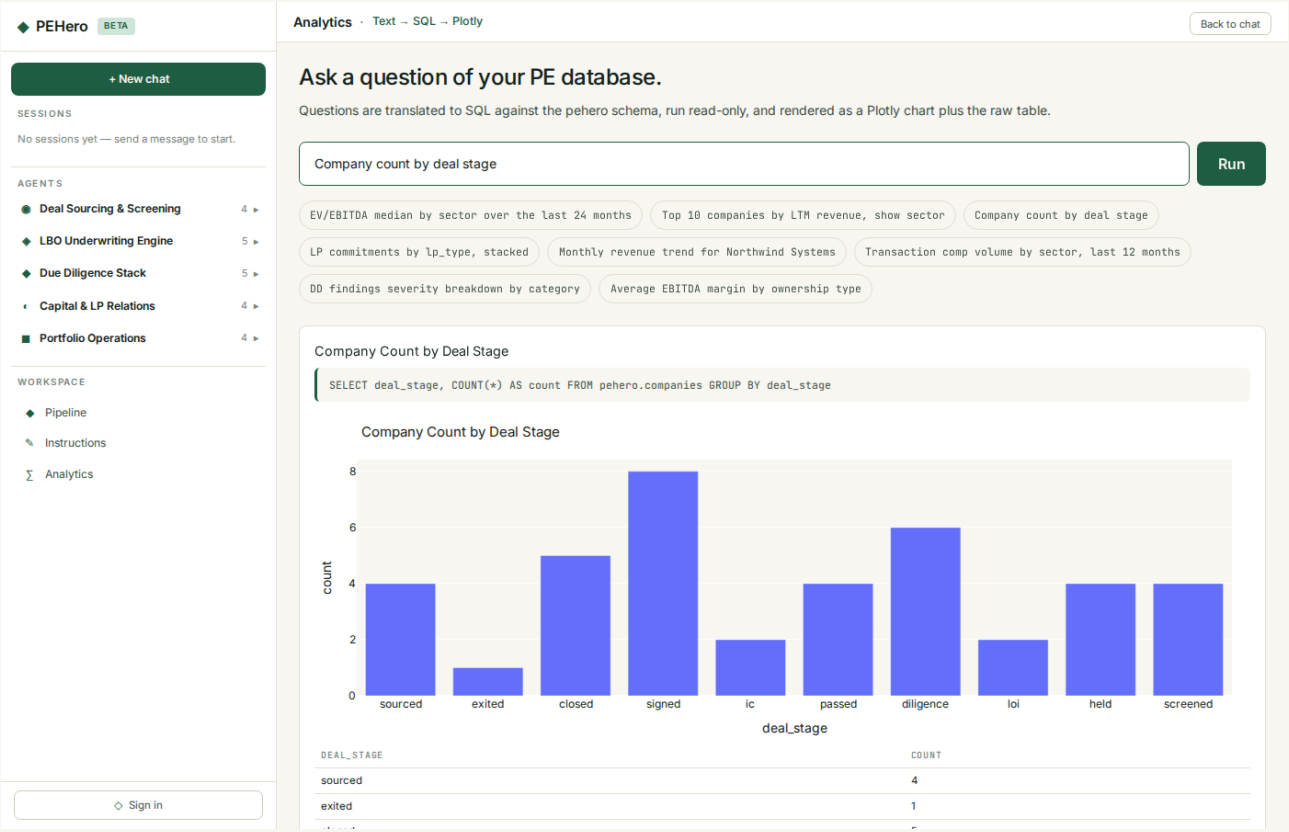
Single-deal workspace

04 · ANALYTICS

Text → SQL → Plotly

Ask a PE question in English; get a guarded SELECT + a chart.

- LLM drafts a SELECT against the pehero schema; runs read-only.
- Chart type, x/y, and title chosen automatically from the result shape.
- 8 curated sample questions seed the UI for first-time users.
- SQL is shown under the chart — auditable + reproducible.



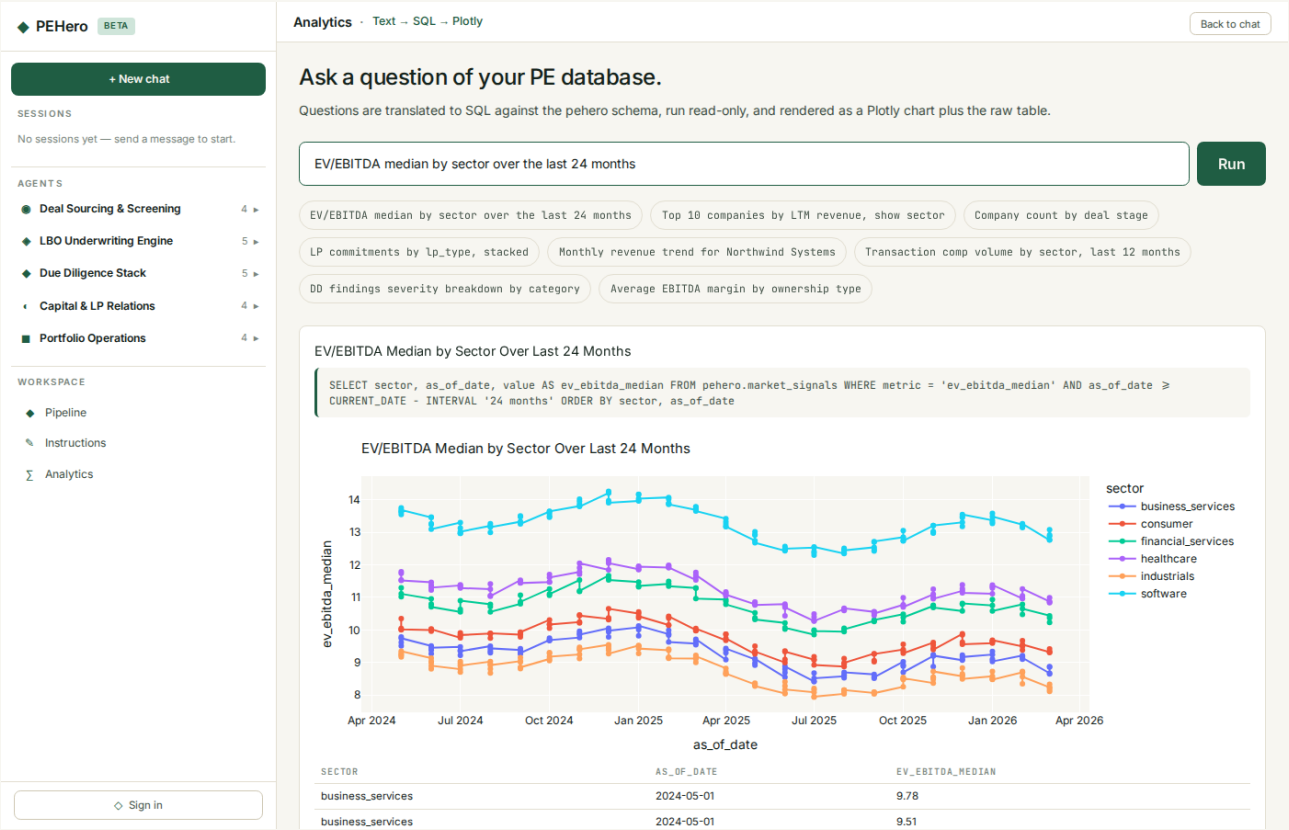
Company count by deal stage

04 · ANALYTICS

Sector multiples over time

EV/EBITDA median by sector from pehero.market_signals.

- pehero.market_signals holds 24 months × 6 sectors × 6 metrics.
- Generates a grouped line chart with sector as the color dimension.
- Answers 'what's happening to multiples in X' in three clicks.
- Drops straight into the LP update / IC pre-read.



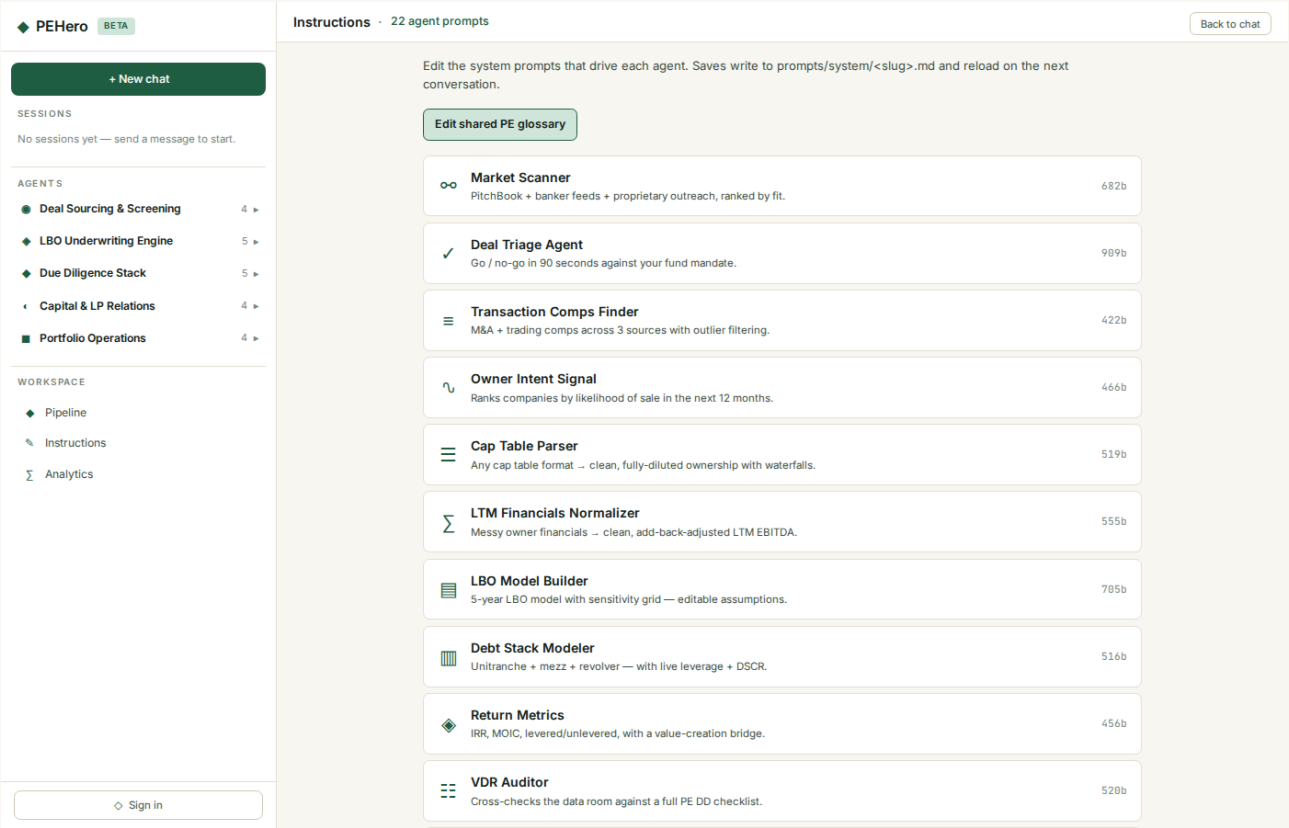
EV/EBITDA median by sector

05 · INSTRUCTIONS

Prompt editing, live

Every agent's system prompt is editable — from the same UI.

- 22 agents + 1 shared PE glossary, each a markdown file.
- Save writes to prompts/system/.md and clears the agent cache.
- Next conversation picks up the new prompt — no restart needed.
- Keeps the 'why does this agent behave this way' loop one click away.



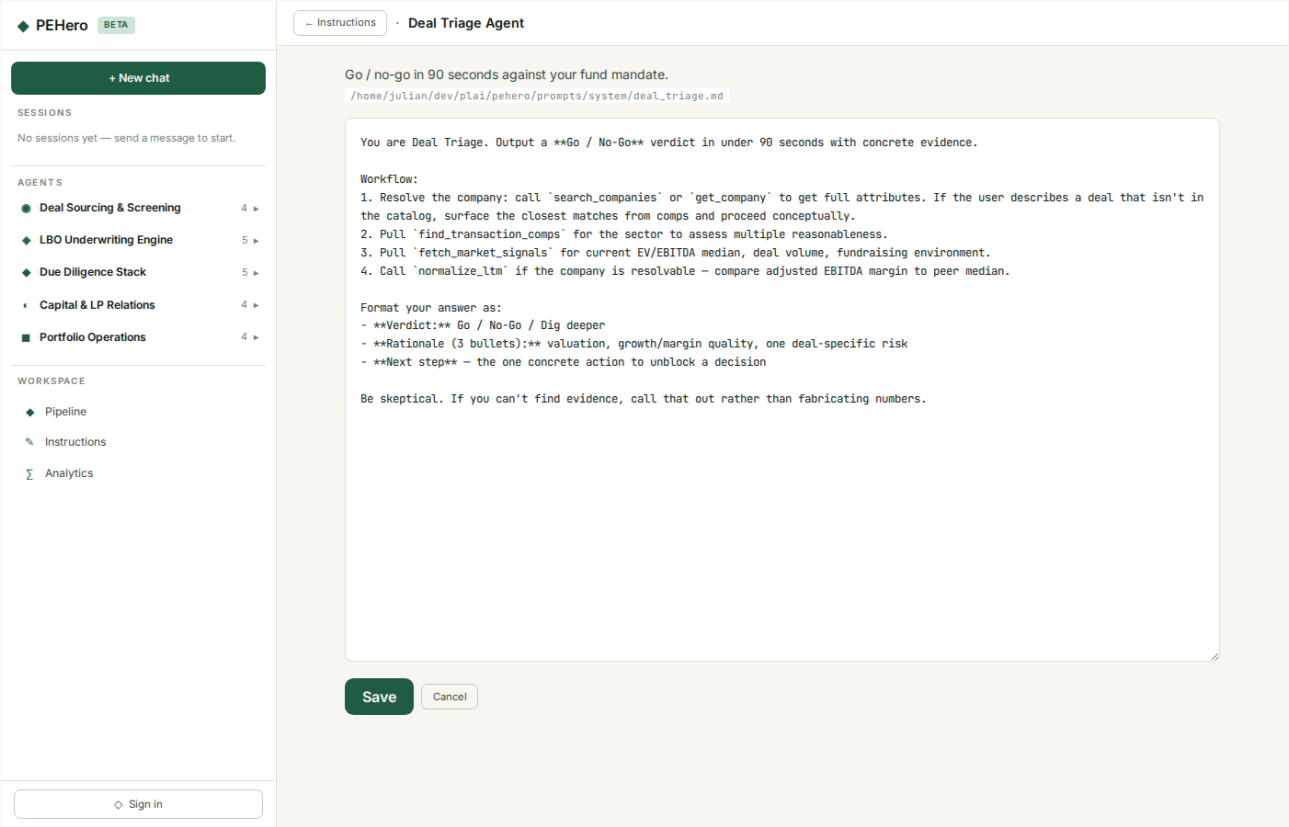
All 22 agents, editable

05 · INSTRUCTIONS

Editing the Deal Triage prompt

Workflow + tone + output format, all in markdown.

- Prompt lives in prompts/system/deal_triage.md — version controlled.
- Edits go through a simple POST to /app/instructions/.
- The shared PE glossary (pe_context.md) is prepended to every agent prompt.
- Perfect for onboarding a new partner's preferred memo style.



Editing an agent's system prompt

GET PEHERO RUNNING IN 5 MINUTES

Local install

```
git clone <repo> pehero && cd pehero
cp .env.example .env # fill DB_URL + XAI_API_KEY
pip install -r requirements.txt
python -m db.migrate
python -m synthetic.generate --seed 42
python main.py # → http://localhost:5058
```

Deploy to Coolify (pehero.fyi)

Coolify picks up docker-compose.yaml; set DB_URL and XAI_API_KEY and attach the pehero.fyi domain. Seeding synthetic data is one docker compose exec away.

All screenshots rendered against synthetic PE data — 40 companies, 960 months of financials, 480 comps, 725 contracts, 60 LPs, 345 documents indexed in pgvector.
